

**Sea trout sample, Flowerdale, Loch Gairloch, 27<sup>th</sup> April 2017. Summary report by Peter Cunningham, [info@wrft.org.uk](mailto:info@wrft.org.uk)**

Lice counts by Peter Cunningham were made in poor light; anaesthetised fish were held under water. Please see photos for some examples on subsequent pages of this report. Team: 7 other helpers. Weather: light north-westerly breeze; rain. Sweep netting at Flowerdale has been supported by Wester Ross Area Salmon Fisheries Board and the Scottish Government.

**Notes:**

<sup>1</sup> For fish which were not weighed, an estimated weight has been obtained based on length, using the average condition factor of 0.88 for the 13 fish in the sample which were weighed.

<sup>2</sup> These figures can be compared with those provided in Taranger *et al* (2014) to categorise into groups according to likelihood of mortality or premature return to freshwater,

based on the assumption that small salmonid post-smolts (<150g body weight) will suffer 100% lice-related marine mortality, or return prematurely to freshwater for sea trout in the wild if they are infected with >0.3 lice per g of fish weight.

Furthermore, the lice related marine mortality is estimated to 50%, if the infection is between 0.2 and 0.3 lice per g fish weight, 20% if the infection rate is between 0.1 and 0.2 lice per g fish weight, and finally 0% if the salmon lice infection is <0.1 g fish weight.

For larger salmonids (over 150 g), Taranger *et al* (2014) assumes that lice-related mortality will be 100% in the group if they have 0.15 lice per g fish weight; 75% for lice infections between 0.1 and 0.15 lice per g fish weight, 50% for lice infections between 0.05 and 0.01 lice per g fish weight, 20% for lice infections between 0.05 and 0.01 lice per g fish weight, and finally 0% if the salmon lice infection is <0.01 lice g fish weight.

For further discussion and assessment of risk, please see Taranger *et al* (2014)

Some photos of sea trout caught in Flowerdale estuary, Loch Gairloch, 27<sup>th</sup> April 2017.

Fish number 1: ST430mm, 672g, condition factor 0.845; carrying 150 copepodid and chalimus lice; 22 adult and preadult lice and 2 ovigerous females. Note bird damage (on both sides of fish). Dorsal fin damage 2 (over 1/3 of dorsal fin damaged). This was the largest fish caught.

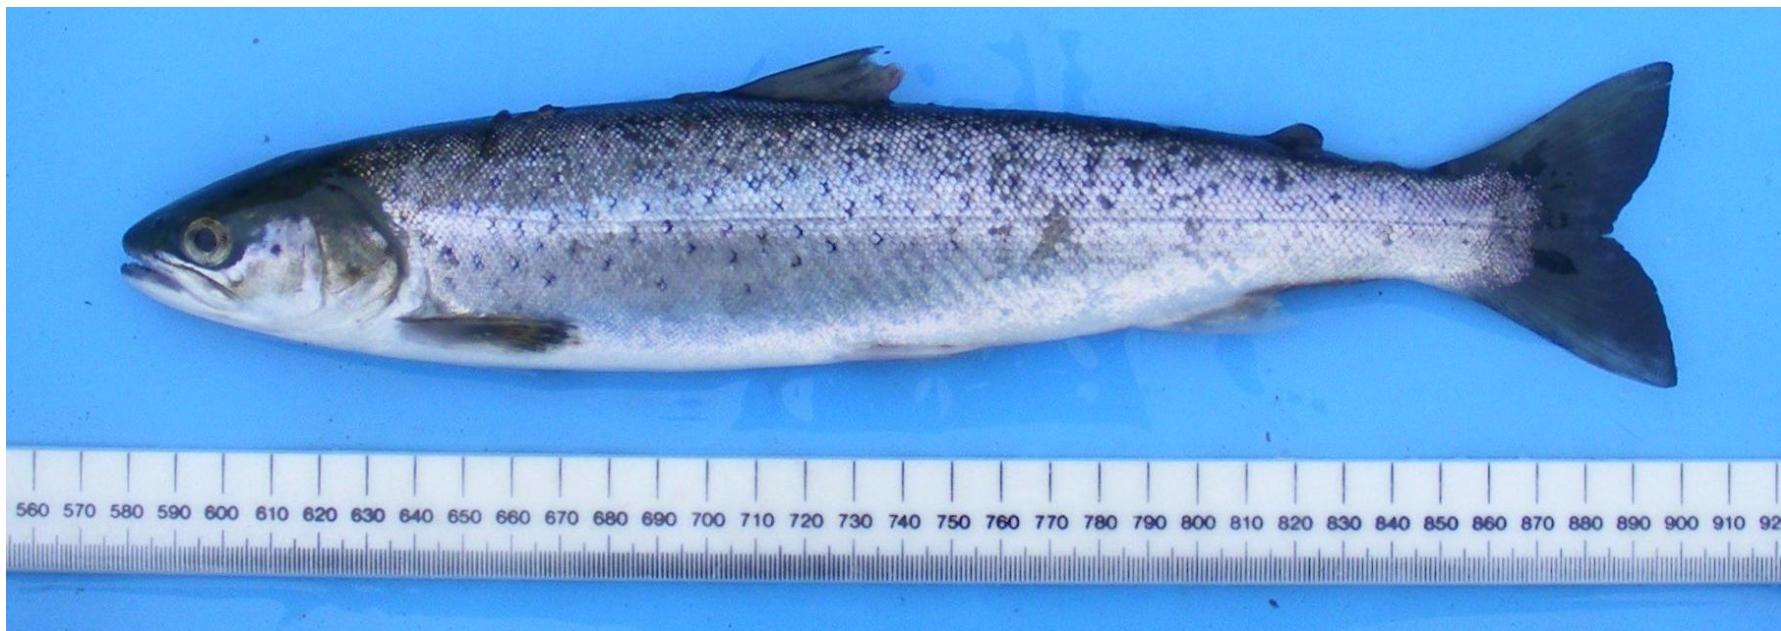

Some photos of sea trout caught in Flowerdale estuary, Loch Gairloch, 27<sup>th</sup> April 2017.

Fish number 6: ST340mm, 358g, condition factor 0.911; carrying 40 copepodid and chalimus lice. This fish had the highest densities of *Cryptocotyle ligua*, which can be seen on the sides of the fish and pelvic fins in the photo below.

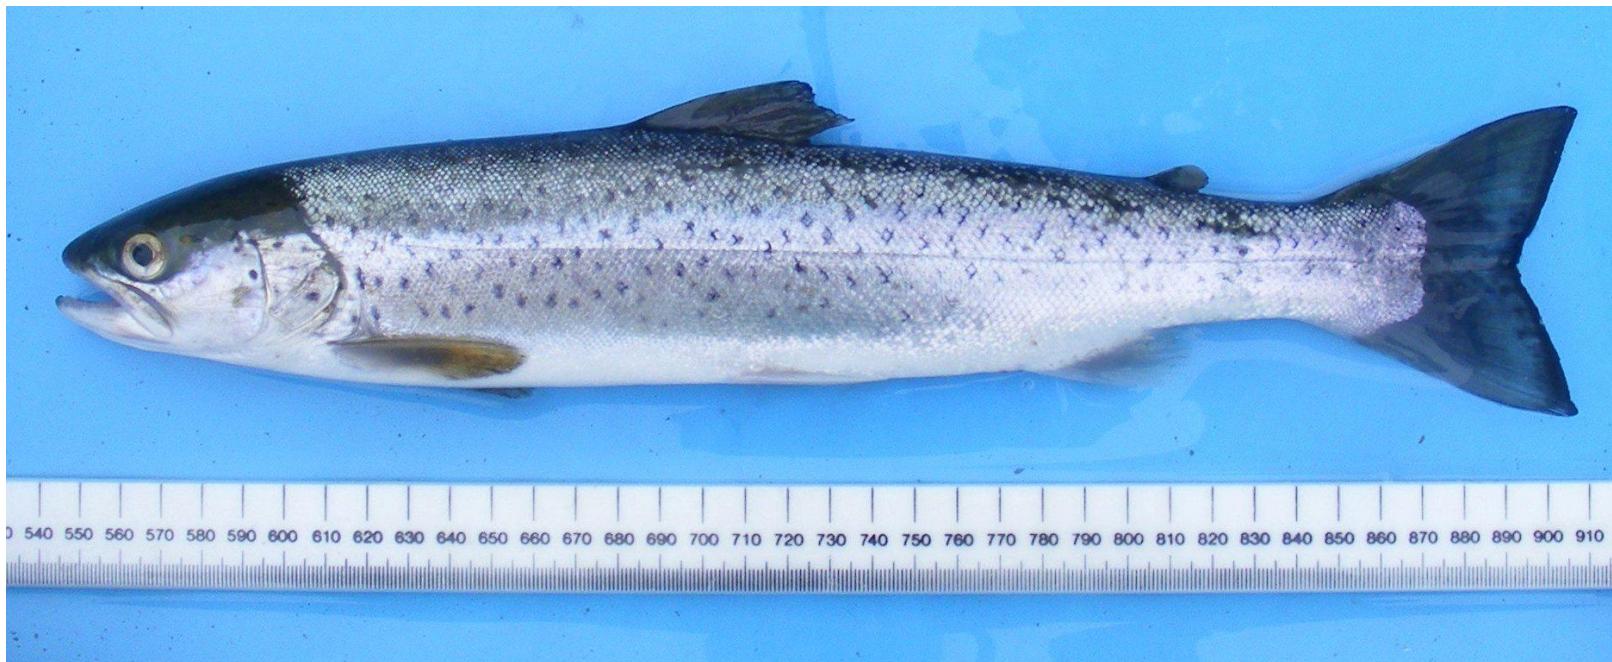

Some photos of sea trout caught in Flowerdale estuary, Loch Gairloch, 27<sup>th</sup> April 2017.

Fish number 13: ST308mm, 271g, condition factor 0.928; carrying 130 copepodid and chalimus lice, 10 adult and preadult lice and 1 ovigerous female louse; dorsal fin damage 2 (over 1/3 of dorsal fin damaged). Note raw ulceration behind ventral fin.

Some photos of sea trout caught in Flowerdale estuary, Loch Gairloch, 27<sup>th</sup> April 2017.

Fish number 15. ST348mm (weight not recorded); 200 copepodid and chalimus lice, 7 preadult and adult lice, 0 ovigerous female lice; dorsal fin damage 0.5.

Some photos of sea trout caught in Flowerdale estuary, Loch Gairloch, 27<sup>th</sup> April 2017.

Fish number 25: ST260mm (weight not recorded); 340 copepodid and chalimus lice, 0 preadult and adult lice, 0 ovigerous female lice, dorsal fin damage 0.5. 'very thin'
